

Hosting a Domain in the Rapid Access Cloud

This tutorial will show you how you can register a domain name and then use the Rapid Access Cloud to host it. This tutorial will use Namecheap as the domain registrar, but any other registrar should also work.

- [Registering a Domain Name](#)
- [Change the Namecheap Nameservers to Point to RAC](#)
- [Configure the Domain in RAC](#)

Registering a Domain Name

First, you need to register a domain name. Use a registrar like Namecheap to search for and register a domain (The steps to do this can be found [here](#)). This will usually cost you between \$10 and \$15.

Change the Namecheap Nameservers to Point to RAC

In the Namecheap control panel, find your domain and click on **Manage**

Under the **Domain tab**, select **Custom DNS** from the **Nameservers** dropdown (Please refer to this [link](#) for more information). Set the DNS servers to the following:

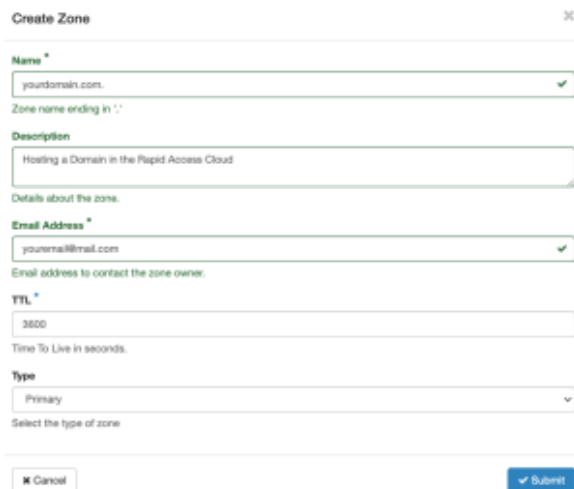

- [ns-yye.cloud.cybera.ca](#)
- [ns-yeg.cloud.cybera.ca](#)

It may take a few minutes for the nameservers to propagate everywhere. You can use a free tool like What's My DNS to check if your nameservers are pointing correctly.

Configure the Domain in RAC

Log in to the Rapid Access Cloud dashboard and perform the following steps:

1. Select DNS Zones and click on create zone

The screenshot shows the 'Create Zone' form in the Rapid Access Cloud dashboard. The form has the following fields and options:

- Name ***: A text input field containing 'yourdomain.com.' with a green checkmark icon on the right.
- Zone name ending in ***: A text input field containing 'com'.
- Description**: A text input field containing 'Hosting a Domain in the Rapid Access Cloud'.
- Details about the zone.**: A section header.
- Email Address ***: A text input field containing 'youremail@mail.com' with a green checkmark icon on the right.
- Email address to contact the zone owner.**: A text input field containing 'youremail@mail.com'.
- TTL ***: A text input field containing '3600'.
- Time To Live in seconds.**: A text input field containing '3600'.
- Type**: A dropdown menu with 'Primary' selected.
- Select the type of zone**: A text input field containing 'Primary'.
- Buttons**: A 'Cancel' button and a 'Submit' button.

2. Fill all information in DNS zones window
3. Click submit

You can also use the [command-line tools](#):

```
openstack zone create yourdomain.com. --email youremail@mail.com
```

Next, create an A and AAAA recordset. To do this in the Rapid Access Cloud dashboard, do the following steps:

1. On DNS zone page click create recordset.

2. Select the record type to A.
3. Fill Name of your domain, description and other values and click submit.

The screenshot shows the 'Create Record Set' form with the following fields and values:

- Type:** A - Address record (selected from a dropdown)
- Name:** yourdomain.com. (with a green checkmark)
- Description:** IPv4 A Record
- TTL:** 3600
- Records:** 101.102.103.104 (with a green checkmark)

At the bottom, there are 'Cancel' and 'Submit' buttons.

4. Repeat steps 1 to 3 to create AAA recordset.

The screenshot shows the 'Create Record Set' form with the following fields and values:

- Type:** AAAA - IPv6 address record (selected from a dropdown)
- Name:** yourdomain.com. (with a green checkmark)
- Description:** IPv6 AAAA Record
- TTL:** 3600
- Records:** 2001:db8:3333:4444:5555:6666:7777:8888 (with a green checkmark)

At the bottom, there are 'Cancel' and 'Submit' buttons.

Alternatively, you can use the command-line tools:

```
$ openstack recordset create --records "IPv4 address" --type A --description "IPv4 A Record" yourdomain.com.test
$ openstack recordset create --records "IPv6 address" --type AAAA --description "IPv6 AAAA Record" yourdomain.com.test
```
